INSPIRED ORCID

I am a particle physicist and am conducting **leading edge research** for New Physics Beyond the Standard Model of Particle Physics as well as precision Standard Model measurements.

I have multiple years of experience in analyzing high-energy collisions at different particle colliders using a multitude of different techniques. I have published many papers in leading journals and am currently a member of the CMS collaboration that is operating one of the 4 detectors at the Large Hadron Collider (LHC) at CERN in Geneva, Switzerland. The CMS collaboration spans the whole globe and encompasses more than 3000 physicists from more than 50 countries out of which over 1000 are students. In my recent studies at the LHC, I have lead searches for evidence of physics beyond the Standard Model using top quarks, and contributed to searches for Supersymmetry and Dark Matter. One of my most noticeable publications is the Observation of the Higgs Boson in 2012.

I am a **leader in scientific computing** and have acquired deep knowledge and expertise in scientific software and computing infrastructure.

High Energy Physics (HEP) requires very large amounts of computing resources to analyze simulations and data recorded by the detectors. I have extensive experience in planning, developing, and operating distributed computing infrastructures that provide access to several hundred-thousand computing cores and hundreds of petabytes of disk space. I am intimately familiar with scientific grid sites, academic and commercial clouds and the largest U.S. supercomputers. I am also an expert in object-oriented software development, statistical data analysis methods and Monte Carlo simulation techniques as well as various optimization and machine learning techniques.

I am part of a worldwide community process to prepare the software and computing infrastructure for the High Luminosity LHC (HL-LHC, 2029), which will require many times the computing resources as today. I was coauthor for the overview white paper of the community and was co-editor of the topical white paper about the future of data analysis in High Energy Physics. My expertise in the community was acknowledged in 2020 when I was called upon to co-lead the Computational Frontier of the Particle Physics Snowmass 2021 process, the particle physics community planning exercise to document a scientific vision for the future of particle physics in the U.S. and its international partners.

I held many management positions within the international CMS collaboration and at the Fermi National Accelerator Laboratory, supervising up to 100 individuals across many time zones. In March 2019, I was appointed U.S.CMS Software and Computing Operations Program manager overseeing the U.S. CMS Tier-1 and Tier-2 facilities as well as software maintenance and development efforts for core software, computing infrastructure software and analysis systems. The operations program receives both funding from the National Science Foundation (NSF) and the Department of Energy (DOE). In this context, I am working together with DOE and NSF and partners at the universities and other labs to enable analysis of LHC particle collisions in the U.S. for the CMS collaboration, and prepare for HL-LHC. To plan the R&D needed for HL-LHC, I co-authored a strategic plan outlining four grand challenges.

I regularly speak at international conferences and workshops and am member of the editorial board of the journal for Computing and Software for Big Science.

Research Positions

09/2019 - Present	Senior Scientist	Fermi National Accelerator Laboratory (Fermilab)
09/2014 - 08/2019	Scientist	Fermi National Accelerator Laboratory (Fermilab)
06/2009 - 08/2014	Application Physicist I	Fermi National Accelerator Laboratory (Fermilab)

March 1, 2024 1 of 9

06/2005 - 05/2009	Research Associate	Fermi National Accelerator Laboratory (Fermilab)
09/2001 - 02/2005	Doctoral Candidate	Deutsches Elektronen Synchrotron (DESY)

Education

2001-2005	University of Hamburg, Doctor of Natural Sciences, Hamburg, Germany
Thesis title	Measurement of beauty quark cross sections in photoproduction with the ZEUS experiment at
	the electron proton collider HERA (thesis)
Advisors	Prof. Dr. Robert Klanner, Dr. Achim Geiser

1996 - 2001 University of Hamburg, Diploma in Physics, Hamburg, Germany

Advisors Prof. Dr. Robert Klanner, Dr. Achim Geiser

Assignments: U.S. CMS Software and Computing Operations Program

03/2019 - present	U.S. CMS Software and Computing Operations Program manager
10/2016 - 02/2019	U.S. CMS Software and Computing Operations Deputy Program manager
10/2016 - 02/2019	L2 manager for Software and Support in the U.S. CMS Software and Computing
	Operations Program Execution Team
03/2014 - 09/2016	L2 manager for Operations in the Software and Computing Operations Program
	Execution Team

Assignments: Fermi National Accelerator Laboratory - Scientific Computing Division

09/2022 - present	Department Head for Computing Resource Evolution Strategy Department
09/2022 - present	CMS Software & Computing Coordinator
10/2019 - 08/2022	Associate Head of the Scientific Computing Division for CMS
10/2016 - 09/2019	Deputy Head of the Scientific Services Quadrant
10/2014 - 09/2016	Assistant Head of the Scientific Computing Division for Science Operations and
	Workflows
10/2014 - 12/2014	Interim Department Head of the Scientific Data Processing (SDP)Department of
	the Scientific Services Quadrant
10/2013 - 09/2014	Deputy Department Head of the Scientific Data Processing (SDP) Department of
	the Scientific Services Quadrant
09/2012 - 09/2014	CMS Operations Group Leader in the Scientific Data Processing (SDP)
	Department of the Scientific Services Quadrant

Assignments: CMS Collaboration - Offline & Computing Project

09/2015 - 09/2019	CMS Offline & Computing Project Focus Area Lead for Infrastructure and
	Resources
10/2014 - 08/2015	Member of the CMS Offline & Computing Project Management Board
01/2012 - 09/2014	CMS Offline & Computing Project Computing Operations L2 Manager
07/2009 - 12/2011	CMS Offline & Computing Project Data Operations L2 Manager
01/2007 - 07/2009	CMS Offline & Computing Project Release Validation Manager

March 1, 2024 2 of 9

Supervision

03/2011 - 02/2016	Jacob Linacre - Fermilab Postdoc in CMS
	- Searches for SM and BSM physics with top quarks
	- 01/2014-12/2015: CMS Physics top quark properties subgroup convener
	- 03/2011-12/2013: CMS Tier-1 production and processing L3 manager
06/2015-06/2021	Matteo Cremonesi - Fermilab Postdoc in CMS
	- Dark matter searches
	- 09/2015-09/2019: CMS L3 manager for processing and production
	- 12/2016-01/2019: Co-lead of CERN openlab/Intel Big Data project
	- 01/2019-present: Co-lead of Coffea project using python industry tools for CMS
	analysis
10/2018-present	Nick Smith - Fermilab Postdoc in CMS
	- Higgs precision measurements in b-quark and other final states
	- $03/2019$ - $12/2019$: CMS L3 manager for data management
	- 01/2020-01/2022: CMS L2 manager for Computing Operaions
	- 09/2021-09/2023: CMS Higgs Combination Sub-Group coordinator
	- $01/2022$ - $01/2023$: U.S. CMS Storage R&D project: Ceph
11/2020-present	Martin Kwok - Fermilab Postdoc in CMS
	- HEP-CCE Portable Parallelization Strategies

Scholarships and Awards

2013	CMS Young Researcher Prize
2008	Exceptional Performance Recognition Award of Fermilab
2003	German Academic Exchange Service scholarship
	for an academic stay at University College London (UCL), London (Great Britain)

Committees

- 10/2015 09/2016: Fermilab's Scientific Advisory Council
- 10/2018 09/2020: Fermilab's Users Executive Committee
- 02/2019 ONGOING: IRIS-HEP Steering Board
- 03/2019 ONGOING: WLCG Management Board
- 03/2019 ONGOING: WLCG Overview Board
- 03/2019 ONGOING: WLCG Collaboration Board
- 03/2019 ONGOING: Openscience Grid Council
- 10/2019 01/2022: Fermilab's Wilson Fellowship hiring committee
- \bullet 01/2020 01/2022: Co-lead of the Computational Frontier of the Particle Physics Snowmass 2021 process
- 02/2023 present: Co-lead of Software & Computing group in U.S. FCC coordination team

Other Professional Activities

- In 2017, I was asked to join the editorial board of the journal for "Computing and Software for Big Science" published by Springer.
- In 2018, I was asked to be Co-Editor of the American Physics Society (APS) Division of Particles and Fields (DPF) white paper as input to the European Particle Physics Strategy Update 2018 2020, responsible for the computing section.
- Organizer of the Computing & Machine Learning parallel session at The CPAD Instrumentation Frontier Workshop 2018 "New Technologies for Discovery IV".

March 1, 2024 3 of 9

- In 2020, I was asked to co-chair the Computational Frontier in the Snowmass 2021 process. Because the Snowmass process was delayed by a year, I needed to resign in 2020 due to previously high priority committments. I oversaw the process till a successor was appointed.
- Active in public outreach:
 - Regular participation in Fermilab's Ask-A-Scientist program as lecturer and answering questions of the general public.
 - Tour guide for Fermilab's Saturday Morning Physics program, especially of the computing facilities.
 - Regular question-and-answer sessions for high school classes visiting Fermilab.
- Active in mentorship programs
 - Since January 2020, I am mentoring a postdoc in the Fermilab Neutrino Division in the context of the inter-divisonal mentoring program of Fermilab.
 - Since April 2022, I am mentoring a postdoc from UCSD in the context of the U.S. CMS collaboration mentoring program. The postdoc has been approinted a faculty position at UFL and I continue to mentor them.

Research Experience

CMS collaboration: 2005 - Present

I joined the CMS collaboration at the LHC in 2005 and my research focus has been the search for New Physics Beyond the Standard Model of Particle Physics as well as precision Standard Model measurements.

I was a founding member of an analysis group with members from Fermilab/UCSD/UCSB, focusing on final states with leptons. The approach proved to be successful; after early publications such as a measurement of the top quark cross section, the focus shifted to new physics and beyond the Standard Model processes. We were leaders of the WW to dilepton analysis in the CMS Higgs discovery paper, and searches for SUSY in same-sign and opposite-sign dilepton as well as single lepton channels. The group is currently continuing the searches for SUSY in lepton final states as well as Standard Model processes.

I have been supervising several Fermilab postdoctoral researchers helping me to pursue my research interests.

- Together with Jacob Linacre, I concentrated on exploiting the dilepton signature to search for pair production of a heavy top-like quark (t'). I continued studying the properties of top quarks exploiting angular distributions of the dilepton final state. We were the first to use the dilepton final state to measure the top pair charge asymmetry at the LHC to further investigate the deviations seen at the Tevatron. We published LHC Run 1 papers for top pair spin correlations and top quark polarization for the 7 TeV and 8 TeV datasets as well as the top pair charge asymmetry for the 7 TeV and 8 TeV datasets.
- From 2015 to 2021, I supervised Fermilab PostDoc Matteo Cremonesi. He created a new dark matter analysis effort at the Fermilab LHC Physics Center (LPC), searching for dark matter particles in various channels. The first publication presented the search for dark matter in events with energetic, hadronically decaying top quarks and missing transverse momentum in the 13 TeV 2016 dataset of LHC Run 2. The second publication describes the search for dark matter produced in association with a Higgs boson decaying to a pair of bottom quarks in the same dataset. The group then concentrated on other mono-object channels with an expanding effort at the LPC.
- Since 2018, I am supervising Fermilab PostDoc Nick Smith. He joined the Higgs efforts of the LPC and is contributing to the analysis of the Higgs decay channel into two bottom quarks, and two charm quarks.

ZEUS collaboration: 2001 - 2005

Before joining CMS, I conducted my graduate research at the University of Hamburg from 2001 to 2005 joining the ZEUS collaboration during the upgrade of the HERA collider and the integration of the new ZEUS micro-vertex silicon strip detector with the goal of measuring beauty quark cross sections in the muon final state.

I first concentrated on the identification of muons. In a team of graduate students, I improved the ZEUS muon reconstruction by exploiting redundancies of the different detector components from tracking, calorimetry, to the

March 1, 2024 4 of 9

muon detectors. I then used the complete pre-upgrade 1996-2000 dataset to extract beauty quark cross sections in photo production. I used the transverse momentum of the muon relative to a jet to identify beauty quarks and measured differential angular correlation cross sections, which were found to be in agreement with NLO predictions. With the first data after the upgrade, the micro-vertex detector became available. I used the dataset from 2003-2004 to identify beauty quarks using impact parameter techniques for the first time in ZEUS. Both measurements were published in my thesis.

Technical Experience

Particle physics is based on particle detection by sophisticated experimental devices and their comparison to accurate simulations. High Energy Physics (HEP) requires very large amounts of computing resources to analyze simulations and data recorded by the detectors. I have deep knowledge of planning, developing, maintaining and operating distributed computing infrastructures providing access to several hundred-thousand computing cores and many hundred of petabytes of disk space. I am intimately familiar with scientific grid sites, academic and commercial clouds and the largest supercomputers at High Performance Computing centers in the U.S. and across the world. The infrastructure then execute scientific software consisting of millions of lines of C++ and python code that is needed to extract physics results. I am an expert in object oriented software development, statistical data analysis methods and Monte Carlo simulation techniques as well as various optimization and machine learning techniques.

These technical aspects of my work are closely connected to my physics research, as they enable the analysis of particle physics detector data and simulations as a basis to extract physics results. My active involvement in HEP science allows me to guide the science community to benefit from the latest computing developments, bridging the worlds of science and IT.

Computing Infrastructure

In March 2019, I was appointed the U.S. CMS Software and Computing Operations Program manager enabling U.S. CMS collaborators to analyze the CMS experiment's data. From October 2016 to February 2019, I was the deputy manager for the same operations program. I am overseeing the operation of the U.S. CMS Tier-1 site at Fermilab and 7 U.S. Tier-2 sites at Caltech, Florida University, MIT, University of Nebraska-Lincoln, Purdue University, UC San Diego, and University of Wisconsin-Madison. The program funds over 60 FTE of effort to administer the sites, maintain the computing infrastructure and aid in strategic R&D projects. To plan the R&D needed for HL-LHC, I co-authored a strategic plan outlining four grand challenges: Modernizing Physics Software and Improving Algorithms; Building Infrastructure for Exabyte-Scale Datasets; Transforming the Scientific Data Analysis Process; and Transition from R&D to Operations.

I am employing my extensive knowledge of scientific software and computing in contributing to the worldwide community efforts to plan for the software and computing infrastucture for the High Luminosity LHC (HL-LHC). Starting in 2029, the HL-LHC will produce many times the amount of data of the current LHC running periods. In addition, the collisions and the corresponding simulations will be many times as complex as today. I was an integral part of the community planning process and my input was documented in the Roadmap for HEP Software and Computing R&D for the 2020s. In addition, I was co-editor of the HEP Software Foundation Community White Paper Working Group - Data Analysis and Interpretation. My expertise in the community was acknowledged in 2020 when I was called upon to co-lead the Computational Frontier of the Snowmass 2021 process. Because the Snowmass process was delayed by one year, I needed to resign in 2022 due to previous high priority committments. I oversaw the process till a successor was appointed.

My recent research interest in computing infrastructure is asking the question if analysis in HEP can be conducted more efficiently using tools developed and used by industry. Instead of employing the ROOT toolkit that was entirely developed by the HEP community, I am exploring using toolkits like Apache Spark or similar technologies. I created a research group spanning researchers from Fermilab, CERN and the Universities Princeton, Padova and Vanderbilt. The CMS Big Data Project is also very closely working together with industry, latest in a project with Intel concluded in January 2019 in the context of CERN openlab. To realize this project, Fermilab joined

March 1, 2024 5 of 9

CERN openlab and I organized the DOE approval process with the help of the Fermilab Office of Partership and Technology Transfer and the Fermilab Legal Office. I also managed a Laboratory Directed Research and Development project (LDRD) to develop innovative technology for Big Data delivery to array-based analysis code, the Striped Data Server for Scalable Parallel Data Analysis. The project concluded successfully in January 2019 and produced a prototype that is currently being used by a diverse set of experiments from collider physics to astro-particle physics. These projects lead to various projects like a user front-end to columnar data tools COFFEA and supporting analysis activities funded through IRIS-HEP.

The CMS collaboration appointed me Focus Area Lead for Services and Infrastructure in the CMS Software and Computing project from 2015 to 2019. I was coordinating the efforts of the worldwide submission infrastructure, innovative new ways of using resources at commercial clouds and supercomputing centers, and the development of computing infrastructure services like data management and workflow management systems.

In September 2019, I was appointed Associate Head of the Scientific Computing Division of Fermilab for CMS. In my role as U.S. CMS Software and Computing Operations Program manager, I am the general contact person for all aspects of CMS software and computing in the Scientific Computing Division and involved in budgetary and personnel planning and major strategy decisions of the division.

From October 2016 to September 2019, I was appointed Deputy Head of the Scientific Services Quadrant. This quadrant is the user facing arm of the Scientific Computing Division, and develops computing infrastructure software components for data and workload management for the whole scientific program of Fermilab, supporting neutrino, muon, and astro-particle experiments as well as CMS.

From September 2014 to September 2016, I was appointed Assistant Scientific Computing Division Head for Science Operations and Workflows in the Scientific Computing Division of Fermilab. I was responsible for the delivery of scientific computing services to all Fermilab experiments, including High Energy Physics experiments (e.g. CMS), Neutrino Physics experiments (e.g. NOvA, Minerva), Intensity Frontier experiments (e.g. mu2e, Muon g-2) and Astroparticle Physics experiments (e.g. DES). As member of the senior management team, I developed strategic plans to evolve the infrastructure and operational procedures. For example, I developed a new storage strategy that simplifies the operation and usage of the more than 30 PB of disk space at Fermilab. I was also responsible for maintaining the computing strategy as part of the Laboratory Strategy Effort and reported to the laboratory directorate.

The CMS collaboration appointed me lead of the Data Operations Project in 2009. Using my deep involvement in analysis and my expertise in computing, I was responsible for the timely delivery of all data and MC samples for analysis, a significant contribution to the overall success of the experiment. In 2012, CMS extended my responsibilities and appointed me to lead all of the CMS Computing Operations Project, adding the care of over 70 computing centers distributed all over the world and all central computing services of CMS. I was supervising the contributions of more than 60 scientists and engineers to the Computing Operations Project worldwide. The team was overseeing the readiness of all the computing facilities and monitor both central workflows and analysis and the transfers of data and MC samples between the sites. Due to my leadership, the CMS collaboration awarded me 2013 the CMS Young Researcher Prize for enabling the Higgs Discovery with computing. This award is given to 10 collaboration members every year. At the same time, I was a L2 manager in the U.S. CMS Software & Computing Operations Program responsible for Computing Operations. In this capacity and also before, I reported regularly to funding agencies and took part in reviews of DOE and NSF.

Software

In January 2020, the DOE Center for Computational Excellence was funded for a 3-year project to enable HEP experiments like ATLAS, CMS, DUNE, LSST, DESI and others to efficiently use HPC installations in the U.S. at the leadership class facilities at Argonne and Oakridge National Laboratories and NERSC at Lawrence Berkeley National Laboratory. I co-wrote the proposal to execute 4 sub-projects to (1) investigate parallel portability solutions (PPS) to develop algorithmic code once and compile it transparently for the various CPU and accelerator-based architectures; (2) Fine-Grained I/O and Storage (IOS) to optimize data structures on disk and in memory

March 1, 2024 6 of 9

and optimize data access on large shared storage systems at HPC systems; (3) Event Generators (EG) to optimize HEP theory code for execution on HPC systems; (4) Complex Workflows (CW) to orchestrate workflows whose steps need different hardware platforms. I was appointed technical lead of the PPS sub-project and am also point-of-contact for the CMS experiment. With my current postdoc Martin Kwok, I am working on portability solutions and their applications to HEP software.

In the U.S. CMS Software and Computing Operations Program, I was responsible for the Software and Support area from October 2016 to February 2019. Under my guidance, the CMS software framework CMSSW was maintained and evolved, as well as critical R&D was started in the areas of vectorized tracking software, machine learning and novel analysis facilities.

Since 2005 and before the start of the LHC data taking in 2010, I was deeply involved in getting the CMS software ready for data taking. I was the lead developer of an innovative tracking algorithm that was used during the commissioning of the CMS detector called RoadSearch. I conducted the first software tutorials in CMS, teaching the CMS community the basics of analysis software and how to perform analysis on the GRID, using a user-friendly GRID analysis tool called CRAB, of which I was one of the lead developers.

During my graduate student time at DESY from 2001 to 2005, I was one of the proponents and lead developers of a new object-oriented and ROOT-based event display. The upgrade of the ZEUS detector made it necessary to integrate the new and changed detector components in the event visualization solution of ZEUS. A client-server structure allowed physicists to display events without direct access to the event store. Online events could also be displayed worldwide with very small latency during data taking.
